## Industry data request - Current ART Switch Trends Among AHOD Participants 2016 to 2017 Period

## Objective

To understand the current HIV treatment landscape in Australia with respect to treatment switching.

## Method

From within the AHOD participants, gather the demographics and clinical data summary of those that switched their ART regimen during the period 1 Jan 2016 to 31 Mar 2017.

## Selection Criteria

[^0]Table 1a: Demographics and Clinical Summary ( $\mathrm{N}=638$ )
(AHOD patients that switched their ART regimen at least once after 1 Jan 2016)

|  | Number | (\%) |  | Number | (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sex |  |  | CD4 (cells/ $\mu$ ) at enrol |  |  |
| Male | 575 | (90.1) | <200 | 56 | (8.8) |
| Female | 62 | (9.7) | 200-500 | 235 | (36.8) |

## Industry data request - Current ART Switch Trends Among AHOD Participants 2015 Period

## Objective

To understand the current HIV treatment landscape in Australia with respect to treatment switching.

## Method

From within the AHOD participants, gather the demographics and clinical data summary of those that switched their ART regimen during the period 1 Jan 2015 to 31 Dec 2015.

## Selection Criteria

[^7]Table 2a: Demographics and Clinical Summary ( $\mathrm{N}=487$ )
(AHOD patients that switched their ART regimen at least once during 2015)

|  | Number | (\%) |  | Number | (\%) |

    ${ }^{3}$ The average time on treatment of the previous regimen prior to switch
    ${ }^{4}$ The closest CD4 and Viral Load measurement at first regimen switch after 1 Jan 2015 (range selected between $<6$ month prior to switch and up to 2 weeks after switch)
    ${ }^{5}$ Proportion of patients with AIDS defining illness prior to enrolment

[^9]:    ${ }^{1}$ Combinations such as Truvada or Descovy are listed by its composition and grouped together by " $/$ " while separate drug entities are shown with " + ". Proportions are calculated based on the total number of switches
    ${ }^{2}$ Proportions are calculated based on the total number of drugs. Abbreviations: PI, protease inhibitor; NRTI, nucleoside analogue reverse transcriptase inhibitors; NNRTI, non-nucleoside analogue reverse transcriptase inhibitors; InSTI, integrase inhibitor; EI, entry inhibitor;
    ${ }^{3}$ The proportions are calculated based on the total number of switches. A boosted regimen contains either $/ \mathrm{r}$ or /c.
    ${ }^{4}$ Number of drug types ever taken e.g. if a patient switched from FTC+TDF to Truvada, it would not be added to the total drug number count, it would still be considered as the patient having only taken 2 drugs ever.

[^10]:    ${ }^{1}$ Age is calculated based on the date of first regimen switch made after 1 Jan 2015.
    ${ }^{2}$ Number of times a patient switched regimen during 1 Jan 2015
    ${ }^{3}$ The average time on treatment of the previous regimen prior to switch
    ${ }^{4}$ The closest CD4 and Viral Load measurement at first regimen switch after 1 Jan 2015 (range selected between $<6$ month prior to switch and up to 2 weeks after switch)
    ${ }^{5}$ Proportion of patients with AIDS defining illness prior to enrolment

[^11]:    ${ }^{1}$ Combinations such as Truvada or Descovy are listed by its composition and grouped together by " $/$ " while separate drug entities are shown with " + ". Proportions are calculated based on the total number of switches
    ${ }^{2}$ Proportions are calculated based on the total number of drugs. Abbreviations: PI, protease inhibitor; NRTI, nucleoside analogue reverse transcriptase inhibitors; NNRTI, non-nucleoside analogue reverse transcriptase inhibitors; InSTI, integrase inhibitor; EI, entry inhibitor;
    ${ }^{33}$ The proportions are calculated based on the total number of switches. A boosted regimen contains either $/ \mathrm{r}$ or /c.
    ${ }^{4}$ Number of drug types ever taken e.g. if a patient switched from FTC+TDF to Truvada, it would not be added to his total drug number count, it would still be considered as the patient having only taken 2 drugs ever.

[^12]:    ${ }^{1}$ Age is calculated based on the date of first regimen switch made after 1 Jan 2015
    ${ }^{2}$ Number of times a patient switched regimen during 1 Jan 2015
    ${ }^{3}$ The average time on treatment of the previous regimen prior to switch
    ${ }^{4}$ The closest CD4 and Viral Load measurement at first regimen switch after 1 Jan 2015 (range selected between $<6$ month prior to switch and up to 2 weeks after switch)
    ${ }^{5}$ Proportion of patients with AIDS defining illness prior to enrolment

[^13]:    * Excluded conversion related switches such as 3TC/ABC + DTG to 3TC/ABC/DTG (Triumeq) or vice versa, and also excluded switches of same regiment but from TDF to TAF
    ${ }^{1}$ Combinations such as Truvada or Descovy are listed by its composition and grouped together by "/" while separate drug entities are shown with " + ". Proportions are calculated based on the total number of switches
    ${ }^{2}$ Proportions are calculated based on the total number of drugs. Abbreviations: PI, protease inhibitor; NRTI, nucleoside analogue reverse transcriptase inhibitors; NNRTI, non-nucleoside analogue reverse transcriptase inhibitors; InSTI, integrase inhibitor; EI, entry inhibitor;
    ${ }^{3}$ The proportions are calculated based on the total number of switches. A boosted regimen contains either $/ \mathrm{r}$ or /c.
    ${ }^{4}$ Number of drug types ever taken e.g. if a patient switched from FTC+TDF to Truvada, it would not be added to his total drug number count, it would still be considered as the patient having only taken 2 drugs ever.
