Acknowledgements

We would like to acknowledge the many people who have assisted with the development and implementation of the NSP NMDC project.

The project received support and input from the following members of the NSP NMDC Reference Group in 2023: Philip Hull (ACT); Kate Jennings (NSW); David Decolongon (NT); Robert Kemp (QLD); Michelle Spudic & Kate Kelly (SA); Myf Briggs (TAS); Gary Morris (VIC); Jude Bevan (WA); Adrian Gorringe & Ele Morrison (Australian Injecting and Illicit Drug Users League); Sione Crawford (Harm Reduction Victoria) and Charles Henderson (NSW Users and AIDS Association).

We also appreciate the valuable assistance provided by Stephanie Stephens (ACT), Benet Brogan (QLD), Michelle Rutter (SA), Rob Knight (VIC), Hollie Chester (WA), and NSP attendees and staff and managers at NSP services.

Ethical approval for this project was obtained from the UNSW Human Research Ethics Committee-A. Formal written permission to access jurisdictional data was sought and obtained from state and territory Health Departments.

The Needle Syringe Program National Minimum Data Collection (NSP NMDC) is funded by the Australian Government Department of Health and Aged Care.

Summary

All Australian states and territories operate needle syringe programs (NSPs), providing a range of services to people who inject drugs (PWID). NSPs are a key component of current and previous National Strategies designed to reduce blood-borne viral infections and their associated morbidity, mortality and personal and social impacts.

NSP services

Since 2017, all jurisdictions have operated the full range of NSP outlet types, with a total of 4,442 NSPs in operation nationally in 2023.

At the end of June 2023, Australia's combined network of jurisdictional NSP services comprised 109 primary, 833 secondary and 3,067 pharmacy NSPs. These face-to-face services were supplemented by 433 syringe dispensing machines (SDMs).

Over the past five years (2019 to 2023) the number of primary, secondary and pharmacy NSPs remained relatively stable, however the number of SDMs increased 27% from 340 in 2019 to 433 in 2023.

Service provision

Based on data collected in February 2023, an estimated 1,823 occasions of service were provided each day at primary and secondary NSPs.

Data on occasions of service (OOS) were collected in late February 2023. The estimated number of OOS at primary and secondary NSPs declined between 2019 and 2020, but this was accelerated in 2021 due to the impacts of the COVID-19 pandemic^{1,2}, which plateaued in 2022 and declined again in 2023. Overall, there was a 29% decline in the estimated annual

OOS observed over the last five years, from 695,000 in 2019 to 490,000 in 2023. However, the increase in distribution (see below) suggests that NSPs may be continuing to provide larger quantities of equipment per OOS.

One third of public sector NSP OOS involved provision of a health education/ intervention and ten percent of OOS involved a referral within or to an external agency in 2023.

Three in five (62%) NSP attendees at public sector NSP services on the 2023 snapshot day were aged between 30 and 49 years of age. Young people (aged less than 25 years) comprised 4% of NSP attendees, while older people (aged 50 years or above) comprised 25% of NSP attendees. Almost three in four (71%) NSP attendees were male. Excluding OOS where Indigenous status was not reported, 22% of NSP attendees identified as Aboriginal and/or Torres Strait Islander.

Stimulants and hallucinogens (47%,predominantly methamphetamine) were the most commonly reported drugs injected on the snapshot day in 2023, followed (32%, by analgesics predominantly heroin) anabolic and agents and selected hormones (14%, predominantly steroids). anabolic Stimulants and hallucinogens were also the most commonly reported drugs injected among older people (46%), while anabolic agents and selected hormones were the most commonly reported drugs injected among young people (43%).

Needle and syringe distribution

In 2022/23, 50.8 million needles and syringes were distributed in Australia.

There was an 8% increase in needle and syringe distribution in 2022/23 compared to the previous twelve-month period (July 2021 to June 2022) but a 4% decrease over the five-year period 2018/19 to 2022/23. There was a 17% increase in needle and syringe distribution observed over the ten-year period (from 2013/14 to 2022/23). Similarly, there was a 7% increase in per capita syringe distribution among the Australian population aged 15-64 years observed over the past 12 months, but a 6% decline over the fiveyear period 2018/19 to 2022/23. There was a 7% increase in per capita needle and syringe distribution over the past decade (from 2.8 syringes in 2013/14 to 3.0 syringes in 2022/23).

In 2022/23, 50.8 million syringes were distributed to an estimated population of 72,886 people who regularly inject drugs in Australia, the equivalent of 698 each per annum, exceeding the UNAIDS definition of high syringe coverage (>200 syringes per PWID per annum) by more than three-fold. Syringe coverage, defined as the proportion of all injections (administered by people who regularly inject drugs) that were covered by a sterile syringe, was 114% in 2022/23.

1. Introduction

Needle syringe programs (NSPs) have been in operation in Australia since 1986 and are a key component of current and National Strategies previous preventing and treating blood borne viral (BBV) infections and sexually transmitted infections (STIs)^{3,4}. The National Strategies aim to reduce the transmission of HIV, hepatitis B and hepatitis C, and STIs and to reduce associated morbidity, mortality and personal and social impacts. It is important to monitor progress towards the aims outlined in the National Strategies, including indicators related to evidence-based prevention programs, such as NSPs⁵. NSPs are also a key element of the harm reduction framework outlined in the National Drug Strategy⁶.

NSPs provide a range of services that aim to reduce the harms associated with injection drug use, including prevention of BBVs through provision of sterile injecting equipment and safer sex materials. Injecting equipment provided by NSPs primarily includes sterile needles and syringes and containers for the safe disposal of used injecting equipment and may also include other injection equipment such as alcohol swabs and ampoules of sterile **NSPs** water. also provide information and education, referral to a range of health and welfare services and some NSPs provide programs to facilitate access to take-home naloxone.

All eight Australian states and territories operate NSP services and collect a range of operational data, including i) agency-level administrative data, ii) service provision and iii) needle and syringe distribution data. Commencing in 2016⁷, this eighth annual NSP NMDC report provides a national summary of data elements in the NSP NMDC Data Dictionary⁸ and a descriptive overview and summary data of NSP services in each jurisdiction.

The NSP NMDC also contributes to reporting against key indicators outlined in the National BBV and STI Surveillance and Monitoring Plan 2018-2022 that accompanies Australia's National HIV and National Hepatitis C Strategies and UNAIDS Global AIDS Monitoring (GAM)9. Indicators are a) Number of needles and syringes distributed per person who injects drugs per year (National BBV and STI Surveillance and Monitoring Plan 2018-2022 and GAM 2022) and b) Proportion of injections covered by a sterile syringe in the previous calendar year (National BBV and STI Surveillance and Monitoring Plan 2018-2022).

NSP NMDC reports are also used for service monitoring and planning at national and jurisdictional levels which benefits both the community of people who inject drugs (PWID) and the broader Australian population.

2. NSP Services

NSP outlet type

In Australia, NSP services are available through a range of outlet types. The NSP NMDC Data Dictionary 2023v5⁸ provides the following definitions for NSP outlet type.

Primary NSPs are dedicated to the provision of services to PWID. Primary NSPs dispense a wide range of sterile injecting equipment, offer needle syringe disposal services, provide information and education on a range of issues relating to injection drug use and have the capacity to make referrals to other health and welfare services as required.

Secondary NSPs operate within existing health or community services with staff that are not solely dedicated to the provision of services to PWID. Secondary NSPs may provide the same range of services as primary NSPs but typically have a limited capacity to deliver specialist services other than the dispensing of sterile injecting equipment and the provision of disposal facilities, although not all secondary outlets provide disposal facilities.

Pharmacy NSPs are community retail pharmacies that dispense needles and syringes to PWID. This includes free dispensing as part of a subsidised scheme, as well as supply of injecting equipment on a commercial basis. Community pharmacies that

independently supply needles and syringes (where there is no association with a state/territory NSP scheme) are not included in the NSP NMDC as there is no way to determine whether syringes are provided to PWID or solely provided to people with medical conditions (for example for IVF treatment).

Syringe dispensing machines (SDMs) provide sterile injecting equipment via vending machines or dispensing chutes. SDMs dispense needles and syringes at no cost or for a small fee and typically operate in locations and at times when other NSP services are unavailable.

The NSP NMDC counted the number of NSPs as the total of primary + secondary + pharmacy + SDMs. If a primary or secondary NSP outlet also operated a SDM these were counted as separate NSPs for the purpose of the NSP NMDC. For example, a fixed site secondary outlet with two SDMs outside the building was counted as 1 x secondary and 2 x SDM.

In June 2023, there were 4,442 NSPs operating nationally (Figure 2.1) and all jurisdictions operated the full range of NSP outlet types. Pharmacy NSPs were the most common outlet type nationally (n=3,067, 69%) and in all jurisdictions (Figure 2.2). Of the 1,375 public sector outlets operating nationally in 2023, 833 were secondary NSPs, 433 were SDMs

and 109 were primary NSPs. Although there were significantly fewer primary outlets compared to secondary and pharmacy outlets, the comprehensive nature of services provided by primary NSPs offers opportunities for PWID to access health care and other services that are crucial to the prevention and treatment of BBVs and the reduction of drug-related harms to individuals and communities.

Figure 2.1 National NSP services (%) by outlet type in 2023

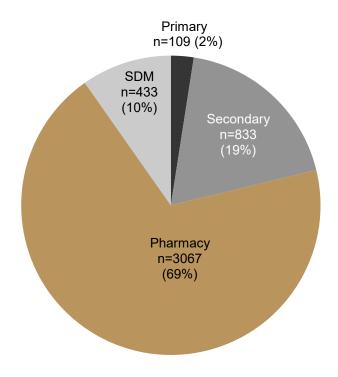

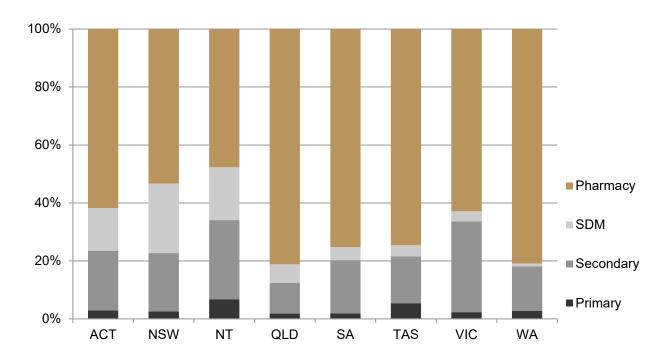

Figure 2.2 Jurisdictional NSP services (%) by outlet type in 2023

Primary and secondary NSPs predominantly operate as fixed site services, although 11 primary and 10 secondary NSPs operated as outreach services without a fixed site in 2023. A substantial proportion (n=65, 60%) of primary NSPs operate multiple modes of service delivery, including a combination of fixed site, mobile, outreach, postal, peer distribution and/or SDM services.

SDMs ensure after-hours access to sterile needles and syringes. All jurisdictions operated SDMs in 2023, with 433 SDMs in use nationally, including approximately 245 secondary outlets that operate SDMs. SDMs predominantly dispense combined 1ml needles and syringes, although a small minority of SDMs dispense larger volume syringes and detachable needles. Two thirds of Australian SDMs (70%) dispensed needles and syringes at no cost to the consumer in 2023. Among the remaining SDMs, the majority (98%) required a consumer payment of between AUD \$2 and \$4.

There was a 54% increase in the total number of NSP outlets over the 15-year period 2008-2023 (Table 2.1). The NSP NDMC collates data on the number of NSP

outlets operating on 30 June at the end of each reporting period. As in previous years, there were minor changes to the number of NSP outlet types in jurisdictions. There was an increase in all outlet types between 2008 and 2023, including a 28% increase in the number of primary NSPs (from 85 in 2008 to 109 in 2023), a 12% increase in the number of secondary outlets (from 745 in 2008 to 833 in 2023), and a 59% increase in the number of pharmacy NSPs (from 1,934 in 2008 to 3,067 in 2023). Notably the number of SDMs operating in Australia has more than tripled, from 118 in 2008 to 433 in 2023 with all jurisdictions providing SDMs since 2018.

Since the inaugural NSP NMDC report in 2016⁷, there has been a 27% increase in the total number of NSPs operating in Australia (from 3,509 in 2016 to 4,442 in 2023). The number of primary (102 in 2016 to 109 in 2023) and secondary NSPs (786 in 2016 to 833 in 2023) were relatively stable over the past eight years. However, there were notable increases among both pharmacy NSPs of 32% (2,321 in 2016 to 3,067 in 2023) and SDMs of 44% (300 in 2016 to 433 in 2023).

Table 2.1 Number of NSP services nationally by type, 2008 and 2016-2023

	200810	2016	2017	2018	2019	2020	2021	2022	2023

Geographic coverage

The ABS ASGS Greater Capital City Statistical Areas (GCCSA)¹² are designed to represent a socio-economic definition of each of the eight state and territory capital cities. This means the greater capital city boundary includes people who regularly socialise, shop or work within the city, but who live in the small towns and rural areas surrounding the city. It does not define the built-up edge of the city. There are eight representing regions each of Australian state and territory capital cities and eight regions covering the rest of each

state and territory. There is only one GCCSA for the ACT and one for the Other Territories of Jervis Bay, Christmas Island and Cocos (Keeling) Islands.

The majority of primary (n=72, 66%) and pharmacy (n=1,837, 60%) NSP outlets are located within greater capital city boundaries, whereas the majority of secondary NSP outlets (n=633, 76%) and SDMs (n=291, 67%) are located in the rest of each state (Figure 2.4).

Figure 2.3 National NSPs (%) by outlet type and greater capital city statistical area in 2023

Note: Location data not available for all services in one jurisdiction

The Australian Bureau of Statistics (ABS) Australian Statistical Geography Standard (ASGS)¹³ provides a geographical standard for the publication of statistics by relative remoteness. The Australian Remoteness Areas categories are 0) Major Cities, 1) Inner Regional, 2) Outer Regional, 3) Remote, 4) Very Remote, 5) Migratory/Offshore/Shipping.

As shown in Figure 2.5, the mix of NSP outlet types varied according geographic region by remoteness area. In 2023, approximately two thirds (n=1,962, 64%) of Australia's 3,067 pharmacy NSPs located in major cities pharmacies comprising the majority (82%) of NSP outlets in this ASGS area. Pharmacy NSPs were also the most common NSP outlet type in inner regional (n=667, 62%) and outer regional (n=389, 52%) areas, however significantly fewer pharmacy NSPs were located in remote

(n=31, 25%) and very remote (n=8, 11%) areas of Australia. Conversely, proportion of secondary outlets increased with remoteness area, with secondary outlets the most common NSP outlet type in remote (n=66, 54%) and very remote 70%) Similarly, (n=49,areas. the proportion of SDMs increased with remoteness area, with two thirds (n=283, 65%) of Australia's 433 SDMs located outside major cities.

The ASGS¹³ Statistical Area 3 (SA3) provides a regional breakdown of Australia with 340 SA3s nationally (excluding nonspatial SA3 special purpose codes). The majority (97%) of SA3 in Australia have at least one NSP outlet. Figures 2.6 and 2.7 provide visual representations of the geographic coverage of primary, secondary, pharmacy and SDM NSP outlets by SA3 in Australia in 2023.

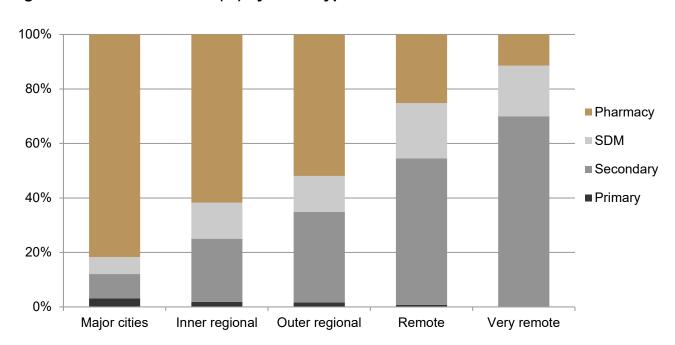

Figure 2.4 National NSPs (%) by outlet type and remoteness area in 2023

Note: Location data not available for all services in one jurisdiction

Figure 2.5 National number of NSPs by outlet type and SA3 in 2023

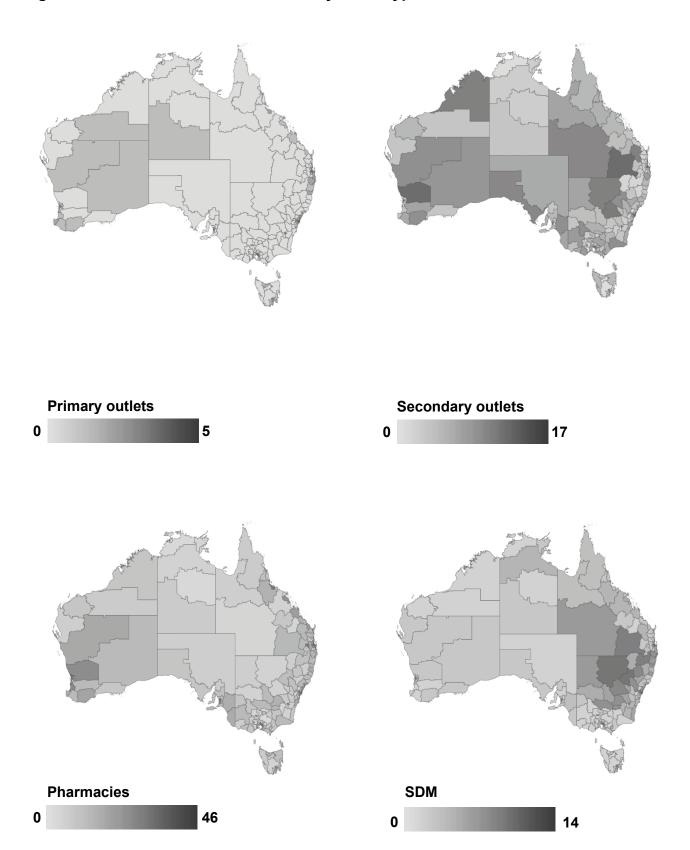

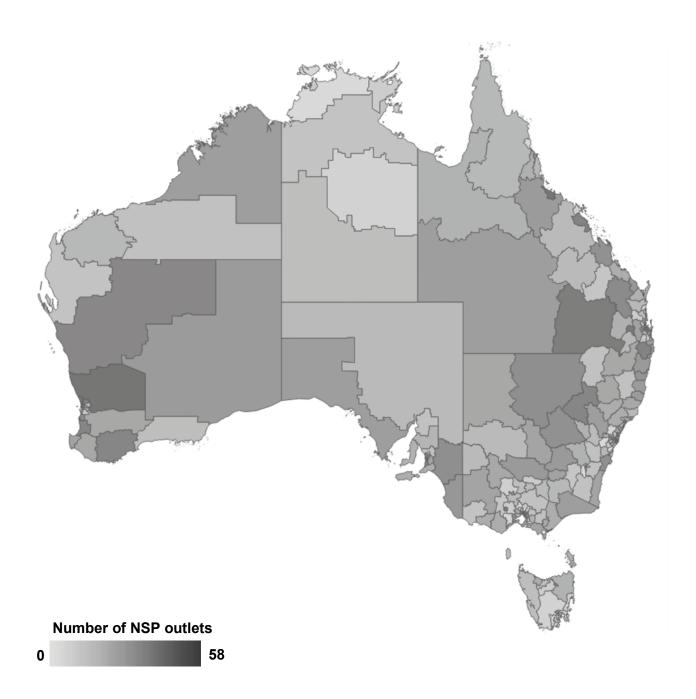

Figure 2.6 National total number of NSP outlets by SA3 in 2023

3. Service Provision

NSP occasions of service

All jurisdictions collect client-level OOS data. Data collection varies according to outlet type with limited capacity at secondary outlets and no capacity at SDMs or pharmacy NSPs. In 2015, the NSP NMDC National Reference Group agreed on four client-level OOS data elements (age, gender, Indigenous status and drug injected) and two service-level OOS data elements (health education/interventions and referrals provided) for inclusion in the NSP NMDC.

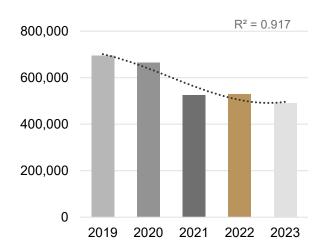

The NSP NMDC Data Dictionary⁸ defines a NSP occasion of service (OOS) as contact between NSP staff and a NSP client in order to transact sterile injecting equipment, advice or other related service from a NSP. The Data Dictionary provides a framework for reporting each of the NSP NMDC client-level and service-level OOS data elements.

Jurisdictional client-level OOS data were collected on a nominated snapshot day during the last week of February in all years. It should be noted that client-level OOS data were not collected from every NSP outlet in some jurisdictions and that client level data were unavailable for a small number of OOS in all years 2019 to 2023 (range n=54 to 81).

Nationally, there were 1,823 occasions of service (OOS) recorded at participating

public sector NSPs in Australia on the nominated snapshot day in February 2023. This equates to an estimated 490,000 OOS provided by public sector NSP services in 2023, the lowest number of OOS observed in any year since the NSP NMDC project commenced in 2016. As shown in Figure 3.1 the estimated number of OOS at primary and secondary NSPs declined by 4% between 2019 and 2020, with an accelerated decline in OOS observed in 2021 which plateaued in 2022 and declined another 7% in 2023. This decline in OOS was not unexpected, as NSPs encouraged clients to ensure they sufficient supplies had of injecting equipment to withstand the possibility of disruptions, COVID-19 including lockdowns. Overall, there was a 29% decline in the estimated annual OOS observed over the last five years, from 695,000 in 2019 to 490,000 in 2023.

Figure 3.1 National OOS, 2019-2023

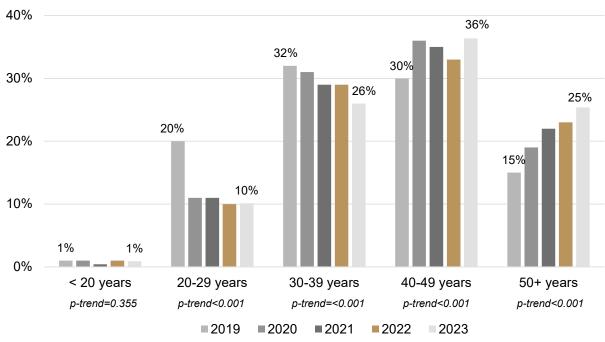

Age

The NSP NMDC Data Dictionary⁸ defines age according to the ABS Age Standard¹⁴ (AGEP: age of the NSP client in a single year). All jurisdictions collected 'age' as a data element in 2023. Most jurisdictions collected age in a single year (AGEP), however two jurisdictions collected age group and the current minimum data available to report in the NSP NMDC is ten-year age groups (AGE10P). It should also be noted that there was minor misalignment with AGE10P and the age categories collected jurisdiction from 2019 to 2022 and some adjustment of data was necessary (see Appendix A: Methodological Notes).

Three in five (62%) OOS at public sector NSPs on the 2023 snapshot day involved NSP attendees aged 30-49 years (26% aged 30-39 years and 36% aged 40-49 years). One in four (25%) OOS involved

NSP attendees who were aged 50 years or older and one in ten (10%) involved NSP attendees aged 20-29 years. Less than one percent of OOS in 2023 involved attendees aged less than 20 years. Young people (aged less than 25 years) comprised four percent (n=66) of OOS at public sector NSPs nationally in 2023. As shown in Figure 3.2, based on the ABS AGE10P grouping, over the period 2019 to 2023 significant increases were observed in the proportion of NSP attendees aged 40-49 years (p-trend<0.001) and those 50+ (p-trend<0.001). aged years Conversely, significant declines were observed in the proportion of NSP attendees aged 20-29 vears trend<0.001) and those aged 30-39 years (p-trend<0.001). The proportion of NSP attendees aged less than 20 years remained low and stable (p-trend=0.355).

Gender

The NSP NMDC Data Dictionary⁸ defined gender according to the 2016 ABS Standard for Sex and Gender Variables¹⁵ which states gender is the distinction between male, female, and genders which are a combination of male and female, or neither male nor female, as reported by the client. All jurisdictions collected gender in 2023, with most jurisdictions (n=6) collecting this data element according to either the 2016 ABS standard or the new ABS Standard for 'Sex, Gender, Variations' of Sex Characteristics and Sexual Orientation Variables' released in 2021¹⁶. The current minimum data available to report in the NSP NMDC is the 2016 ABS standard where permissible values are: 1) Male, 2) Female and 3) Other.

Consistent with previous years, on the snapshot day in 2023, almost three

quarters (71%) of NSP OOS recorded involved male NSP attendees and one quarter involved females. Six NSP OOS (<1%) recorded on the snapshot day in 2023 involved people who identified their gender as 'other'.

Females comprised between one fifth and one third of NSP attendees in all age groups in all years 2019 to 2023, except among NSP attendees aged <20 years, where the proportion of females ranged from 25% in 2021 to 50% in 2023. As shown in Figure 3.3, over the period 2019 to 2023 a significant decrease was observed in the proportion of females aged 30-39 years (p-trend=0.023), however the proportion of females in all other age groups was stable over this period.

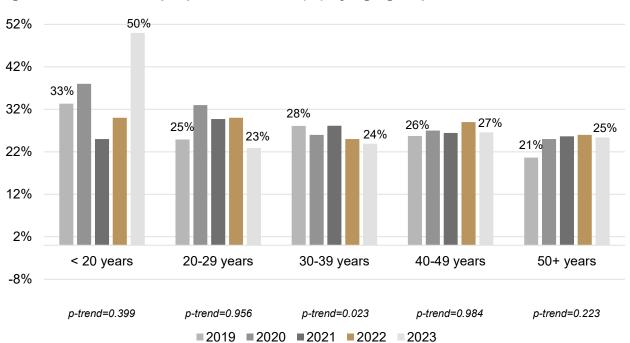

Figure 3.3 National proportion female (%) by age group, 2019-2023

Indigenous status

The NSP NMDC Data Dictionary⁸ uses the ABS Indigenous Status Standard¹⁷, which defines Indigenous status as "Whether a person identifies as being of Aboriginal or Torres Strait Islander origin."

The permissible values are: 1) Aboriginal but not Torres Strait Islander origin, 2) Torres Strait Islander but not Aboriginal origin, 3) Both Aboriginal and Torres Strait Islander origin, 4) Neither Aboriginal nor Torres Strait Islander origin. Seven of the eight jurisdictions currently collect client-level OOS data on Indigenous status, although data collection is not aligned to the ABS standard in one of these jurisdictions. The minimum reporting in the

2023 NSP NMDC is Indigenous status as a binary response; 'Yes, Aboriginal and/or Torres Strait Islander origin' or 'Neither Aboriginal nor Torres Strait Islander origin'.

Excluding OOS where Indigenous status was not reported, 22% (n=314) of NSP OOS on the 2023 snapshot day involved NSP attendees who identified as Aboriginal and/or Torres Strait Islander (Figure 3.4). Over the period 2019 to 2023 the proportion of attendees who identified as Aboriginal and/or Torres Strait Islander was stable (range 20% in 2019 to 22% in 2023, p-trend=0.136).

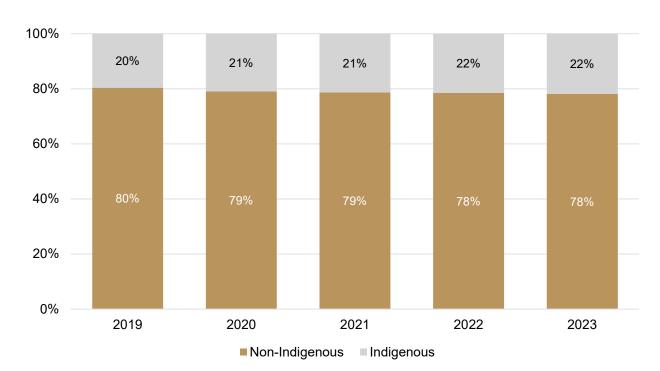

Figure 3.4 National OOS (%) by Indigenous status, 2019-2023

Note: One jurisdiction did not collect data on Indigenous status in any years 2019-2022, and one jurisdiction did not collect data on Indigenous status in 2019.

Drugs injected

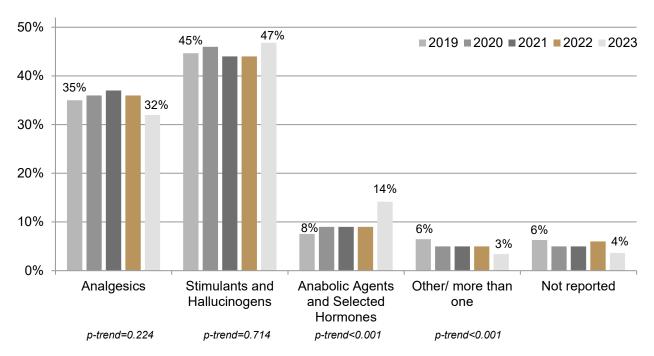

The NSP NMDC uses the ABS Drugs of Concern Classification 18 Broad and Base level groups to report on the drug/s injected as defined in the NSP NMDC Data Dictionary⁸. The NSP **NMDC** Data Dictionary⁸ defines drugs injected as the drug (or drug type), as stated by the client. Given differences in existing jurisdictional data collections, this is either the drug the client is intending to inject following the current OOS (three jurisdictions) or the drug last injected by the client on the most recent occasion of injection jurisdictions). One jurisdiction did not have all sites collecting client-level OOS data on drug/s injected in 2023.

Figure 3.5 illustrates the breakdown of drugs injected by NSP attendees on the nominated snapshot day between 2019

and 2023 according to ABS Drugs of 2023 Concern Broad Groups. In Stimulants and Hallucinogens were the most commonly reported class of drugs injected for the sixth consecutive year (n=618, 47%), followed by Analgesics (n=422, 32%) and Anabolic Agents and Selected Hormones (n=187, Injecting more than one drug subtype was reported at 3% (n=45) of OOS at public sector NSPs nationally in 2023.

Over the period 2019 to 2023, a significant increase was observed in the proportion of NSP attendees who reported anabolic Agents and Selected Hormones as the class of drugs injected (p-trend<0.001). The proportion of all other classes of drugs was stable over this period.

Figure 3.5 National OOS drug injected (%) by ABS Drugs of Concern Broad Groups, 2019-2023

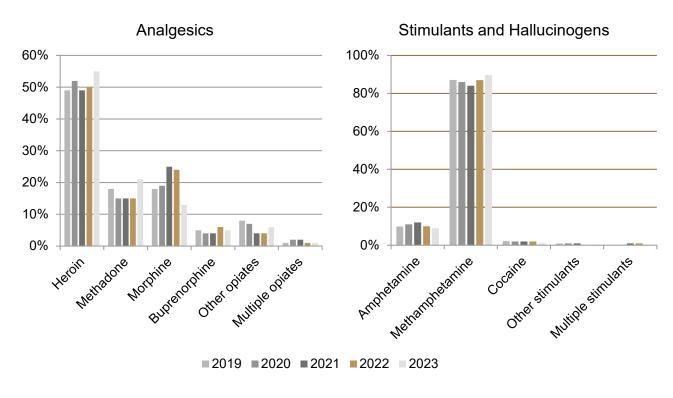

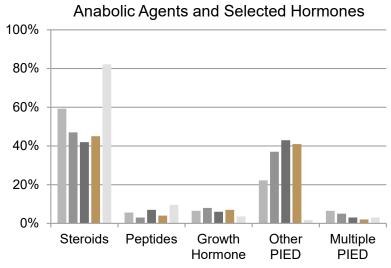

Note: One jurisdiction did not collect data on drug injected in any years 2019-2022

Six jurisdictions collected data that aligned with the ABS Drugs of Concern Base level definitions (n=1,068 in 2023). Heroin (n=198, 55%) was the most commonly reported drug injected in the 'Analgesics' category, while the most commonly reported drug injected by NSP clients in

the 'Stimulants and Hallucinogens' category was methamphetamine (n=423, 90%, Figure 3.6). In 2023, steroids (n=138, 82%) were the most commonly reported drug injected in the 'Anabolic Agents and Selected Hormones' category.

Figure 3.6 National OOS drug injected (%) by ABS Drugs of Concern Broad Groups and Base Groups, 2019-2023

Note: Among the six jurisdictions that collected ABS Drugs of Concern at Base level units

Young people

Among n=53 young people (aged less than 25 years) attending NSPs on the snapshot day in 2023 and excluding the OOS that did not collect data on drugs injected, Anabolic Agents and Selected Hormones were the most commonly reported drug class last injected, reported by 43% of young people in 2023. This was followed by Stimulants and Hallucinogens (32%) and Analgesics (23%). Two percent of young people did not report drug injected.

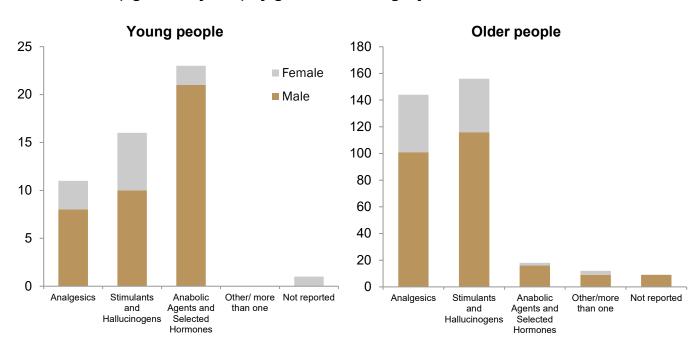

Men accounted for 78% of OOS involving a young person in 2023. Men comprised 67% of young people who injected Analgesics, 59% of those who injected Stimulants and Hallucinogens and 91% of those who injected Anabolic Agents and Selected Hormones (Figure 3.7).

Older people

The NSP NMDC defines older people as those aged 50 years and over. Among n=358 OOS involving older people on the snapshot day in 2023 and excluding the OOS that did not collect data on drugs injected, 46% reported injecting Stimulants Hallucinogens, 43% and reported injecting Analgesics and 5% reported injecting Anabolic Agents and Selected Hormones. Four percent of older people reported injecting more than one drug and 3% did not report drug injected.

Consistent with previous years, men comprised the majority (70%) of OOS that involved older people. Men comprised 71% of older people who injected Stimulants and Hallucinogens, 66% of those who injected Analgesics and 89% of those who injected Anabolic Agents and Selected Hormones (Figure 3.7).

Figure 3.7 National OOS among young people (aged <25 years) and older people (aged ≥50 years) by gender and drug injected in 2023

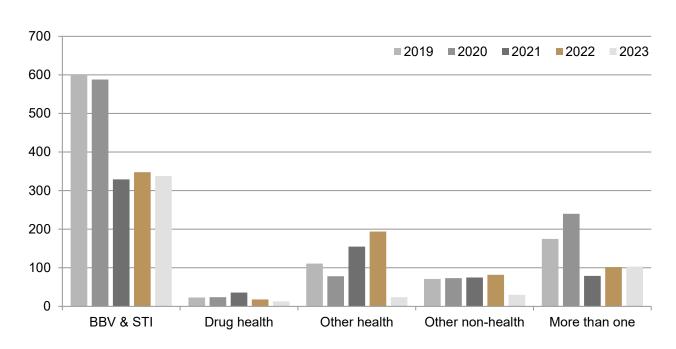

Health education/interventions provided

A health education/intervention is defined as the provision of information, education or a brief intervention to a client by NSP staff at an occasion of service. Given some inconsistency in the way this data element is currently collected in jurisdictions, the NSP NMDC uses a two-level hierarchical structure to collate health education/intervention(s) into broad groups. It should also be noted that not all secondary NSP services have the capacity to provide a range of health education/interventions to PWID who attend their services.

Where detailed data on health education/ intervention were available, data were recoded into the five broad groups defined in the NSP NMDC Data Dictionary⁸: 1) BBV and STI, 2) Drug health, 3) Other health, 4) Other non-health and 5) Peerbased.

Among NSP services that collected data on the provision of health education/ interventions in 2023, one third (32%, n=516) of OOS at public sector NSPs included the provision of health education/ interventions. This represents a decrease in OOS that included provision of health education/ interventions over the past five years from 47% in 2019 to 32% in 2023 (p<0.001). As shown in Figure 3.8, two thirds (n=338, 67%) of health education/ interventions related to BBVs and STIs (including safer injection practices and vein care) in 2023. One in five OOS included the provision of more than one health education/ interventions (n=103, 20%). Other non-health (n=30, 6%), other health (n=24, 5%) and drug health (n=13, 3%) made up the remainder of education/ interventions in 2023.

Figure 3.8 National NSP OOS health education/interventions, 2019-2023

Referrals

Primary and secondary NSP services also provide attendees with referrals to a range of health, welfare, legal and other agencies. The NSP NMDC Data Dictionary⁸ defines referral as "The type of service or agency to which a client is referred during a NSP service contact."

As with health education/interventions and described previously, the NSP NMDC uses a two-level hierarchical structure to collate referrals due to some inconsistency in the way this data element is currently collected at the jurisdictional level. The hierarchical structure of this data element enables recoding of existing jurisdictional data into broad groups. Although all jurisdictions collect this data element, a minority of secondary NSP services have the capacity to provide or collect referral data. The NSP NMDC project recoded

referral data into the following five broad groups: 1) BBV and STI, 2) Drug health, 3) Other health, 4) Other non-health and 5) Peer-based.

Of the NSP services that recorded data on referrals on the snapshot day in 2023, one in ten (n=160, 10%) OOS at public sector NSPs involved the provision of a referral. Approximately three-fifths (n=94, 59%) of referrals were made to BBV and STI services, while a further one in five (n=31, 19%) were made to other non-health services. Smaller proportions of referrals were made to other health services (n=14, 9%) or drug health services (n=11, 7%). Multiple referrals were provided by a minority of NSP OOS that involved a referral (n=10, 6%). Figure 3.9 shows national NSP OOS referral destinations from 2019 to 2023.

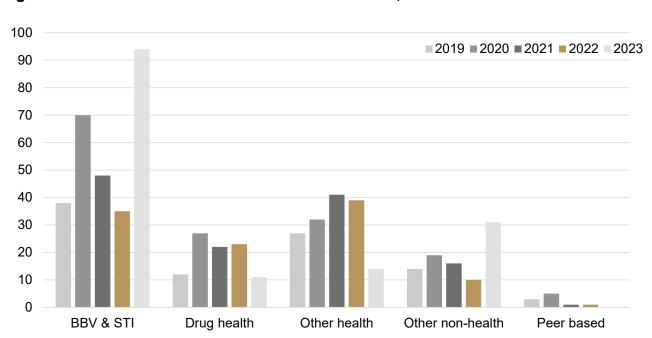

Figure 3.9 National NSP OOS referral destinations, 2019-2023

4. Needle and Syringe Distribution

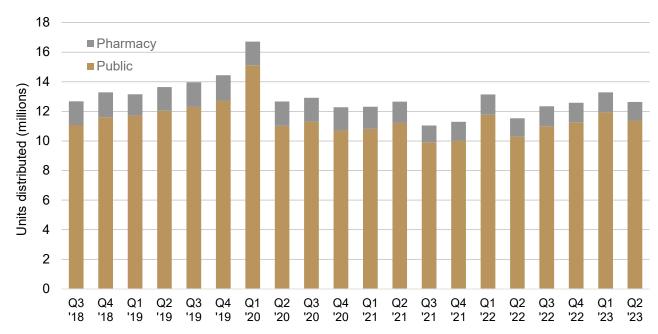

The NSP NMDC used the NSP NMDC Data Dictionary⁸ definition for 'Needles and syringes distributed' which includes a description of 1) combined needle and syringe, 2) syringe without needle and 3) needle without syringe. Because injection requires both a needle and a syringe, the Data Dictionary guide states "the total number of needles and syringes is obtained using the calculation: 'Combined needle and syringe' + 'syringe without needle' to avoid double counting".

The NSP NDMC reports needle and syringe distribution by financial year. The most recent reporting period from July 2022 to June 2023 covers the period following the global COVID-19 pandemic. Known pandemic impacts on needle and syringe distribution included a) stockpiling of injecting equipment following the declaration of a global pandemic in March

2020, b) encouragement of clients to procure sufficient quantities of injecting equipment to manage the impacts of COVID-19 public health measures, such as lockdowns and c) modifications to NSP operating procedures to ensure social distancing².

As shown in Figure 4.1, public sector needle and syringe distribution was inflated in the January to March quarter of 2020 largely due to stockpiling that resulted from concerns regarding the potential for COVID-19 disruptions to supply chains and/or service delivery. Quarterly needle and syringe distribution was subsequently stable over the past three years from July 2020 to June 2023, albeit at ~12.3 million needles and syringes distributed per quarter, more than two million lower than the ~14.4 million distributed per quarter in 2019/2020.

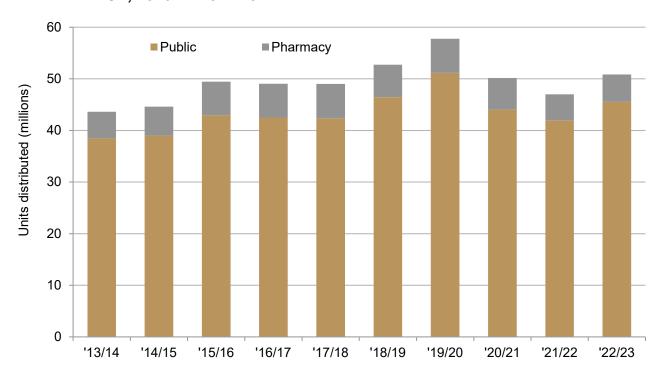

Figure 4.1 National needle and syringe distribution by public and pharmacy sector NSP, 2018/19-2022/23 by quarter

In 2022/23, 50.8 million needles and syringes were distributed nationally in Australia (Figure 4.2). This represents an 8% increase compared to the previous twelve-month period (July 2021 to June 2022) but a 4% decrease in needle and syringe distribution over the five-year

period 2018/19 to 2022/23. There was a 17% increase over the ten-year period from 2013/14 to 2022/23. In 2022/23, the public and pharmacy sectors dispensed 45.6 million (90%) and 5.3 million (10%) needles and syringes respectively.

Figure 4.2 National needle and syringe distribution by public and pharmacy sector NSP, 2013/14-2022/23

Per capita needle and syringe distribution

Per capita needle and syringe distribution was calculated by dividing the number of needles and syringes distributed by the Australian population aged 15-64 years. The denominator excluded children (aged less than 15 years) and older people (65 years and older) as injection drug use is less prevalent in these age groups. Calendar year ABS population data was converted to financial year by calculating the mean of the population estimate in

consecutive calendar years. The per capita rate of needles and syringes distributed nationally increased by 7% over the ten-year period from 2013/14-2022/23, however there was a 6% decline over the five-year period from 2018/19 to 2022/23. There was a 7% increase between 2021/22 and 2022/23 (Table 4.1 and Figure 4.3).

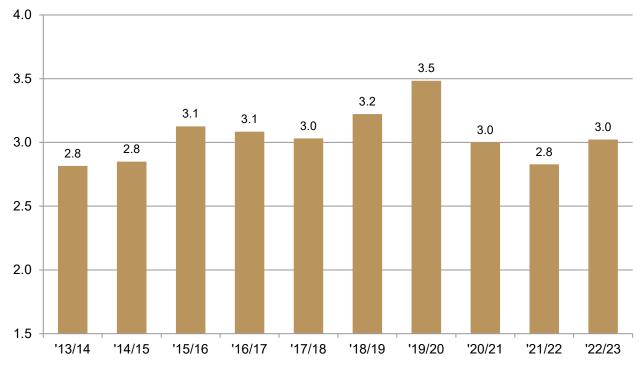

Table 4.1 National syringe distribution and per capita syringes distributed, 2013/14-2022/23

Year	Needle and syringe distribution (millions)			Per capita needles/syringes	
	Public	Pharmacy	Total	rei capita needles/synnges	
2013/14	38.5	5.2	43.6	2.8	
2014/15	39.0	5.6	44.6	2.8	
2015/16	42.9	6.5	49.5	3.1	
2016/17	42.5	6.6	49.1	3.1	
2017/18	42.4	6.6	49.0	3.0	
2018/19	46.4	6.3	52.8	3.2	
2019/20	51.2	6.6	57.8	3.5	
2020/21	44.0	6.1	50.2	3.0	
2021/22	42.0	5.0	47.0	2.8	
2022/23	45.6	5.3	50.8	3.0	

Notes: Denominator for per capita needles and syringes is the population aged 15-64 years.

Totals may not add up due to rounding

Figure 4.3 Per capita needle and syringe distribution, 2013/14-2022/23

Note: Denominator for per capita needles and syringes is the population aged 15-64 years.

Syringe distribution per PWID

UNAIDS Global AIDS Monitoring includes 'needles and syringes distributed per person who injects drugs' as one of the key indicators for reporting on the global AIDS response⁹. UNAIDS defines syringe coverage as 'low' (<100 syringes per PWID per annum), 'medium' (100-200 syringes per PWID per annum) and 'high' (>200 syringes per PWID per annum) and 'high' (>200 syringes per PWID per annum) 19. In addition, the World Health Organization Global Health Sector Strategy on Viral Hepatitis, 2022–2030²⁰ has set a target of 300 syringes per PWID per annum by 2030.

Building on previous methods used to estimate the Australian PWID population size²¹, a method to generate annual estimates of the PWID population size was developed by Kwon and colleagues²².

PWID were defined as people who had injected drugs in the previous 12 months and included people who inject drugs on a regular basis (defined as people who had injected for at least 12 months, an average of 10 times per month, with injecting in most months) and people who inject drugs occasionally (defined as people who injected at least once in the last 12 months, but not frequently enough to be considered a person who injects drugs on a regular basis).

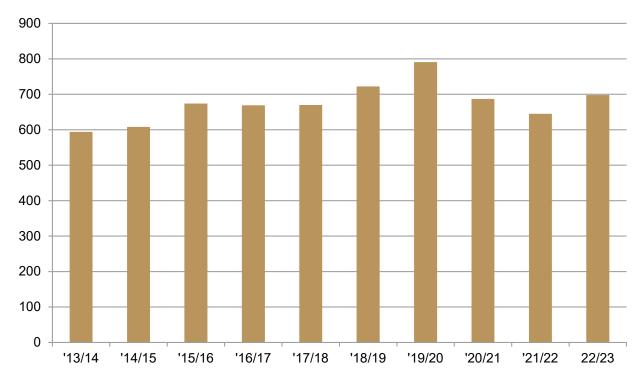

As in previous years, the NSP NMDC used a range of annually updated data sources to estimate trends in the size of the Australian population of people who inject drugs on a regular basis (see Methodological Notes, Appendix A).

There were an estimated 72,886 people who inject drugs on a regular basis in Australia in 2022/23 and this population was stable over the past decade (Table 4.2). The mean number of syringes per PWID was calculated by dividing the number of syringes distributed by the estimated number of people who inject drugs on a regular basis in each financial year. As shown in Figure 4.4, although there was an 18% increase in syringes distributed per PWID between 2013/14 and 2022/23, the number of syringes per PWID declined by 3% between 2018/19 and 2022/23. In 2022/23 an estimated 698 syringes were distributed per person who injects drugs on a regular basis, the equivalent of 1.9 syringes per day and exceeding the UNAIDS definition of high syringe coverage by three-fold.

Table 4.2 National syringe distribution per PWID*, 2013/14-2022/23

Year	Number of people who inject on regular basis*	Syringes distributed (millions)	Syringes per PWID*
2013/14	73,502	43.6	594
2014/15	73,423	44.6	608
2015/16	73,350	49.5	674
2016/17	73,284	49.1	669
2017/18	73,112	49.0	670
2018/19	73,061	52.8	722
2019/20	73,014	57.8	791
2020/21	72,969	50.2	687
2021/22	72,926	47.0	645
2022/23	72,886	50.8	698

Figure 4.4 National syringe coverage per PWID*, 2013/14-2022/23

Note: * Syringes per PWID includes people who inject on a regular basis and excludes those who inject occasionally

Syringe coverage per injection

Although the calculation of the mean number of syringes distributed per PWID is a useful tool to monitor trends over time. it does not take frequency of injection into Additional analyses account. conducted to assess the extent to which demand for sterile syringes was met. Data on frequency of injection was obtained from the Australian NSP Survey²³ (ANSPS) and the methodology described in Kwon et al²² estimated the number of sterile syringes required to cover all injections among people who inject drugs on a regular basis (assuming one sterile syringe was used per injection).

The following assumptions were used: injection >3 times per day required a mean of 5 (range 4-6) syringes per day, injection 2-3 times per day required a mean of 2.5 (range 2-3) syringes per day, injection

once per day required one syringe per day, injection more than weekly but not daily required a mean of 3.5 (range 2-6) syringes per week and injection monthly but not weekly required a mean of 0.5 (range 0.3-0.9) syringes per week.

As shown in Figure 4.5, there were some changes in the frequency of injection reported among ANSPS respondents over the past five years, however these were not statistically significant. Among those who reported injection in the previous month, the proportion who reported injecting more than once per day (p-trend=0.057), the proportion who reported injecting less than daily (p-trend=0.082) and the proportion of respondents who reported injecting once per day, were all stable (p-trend=0.908) over the past five years.

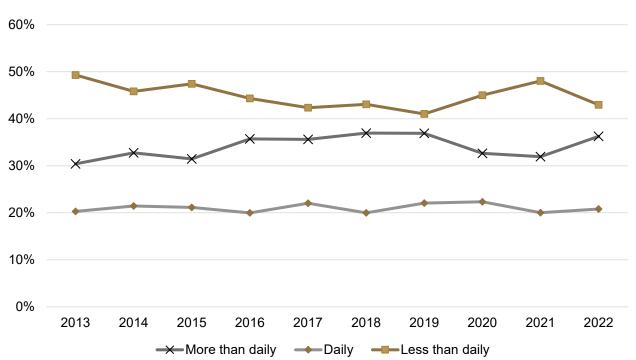

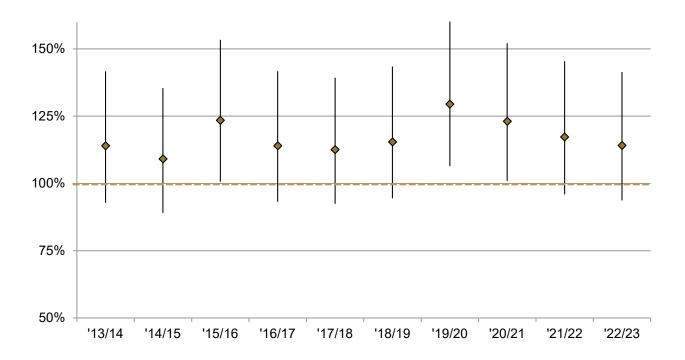

Figure 4.5 Frequency of injection among ANSPS respondents (%), 2013-2022

Figure 4.6 shows the mid-point and lower/upper syringe coverage estimates over the period 2013/14 to 2022/23. Syringe coverage was 100% or higher in all years 2013/14 to 2022/2023. It is important to note that syringe coverage of greater than 100% is required to accommodate syringes utilised by people who inject drugs occasionally and syringes that are not used for an injection (for example, drawing up needles/syringes, wastage, failed injection attempts or stockpiling).

Syringe coverage per injection among the population of people who inject drugs on a regular basis remained high at 114% in 2022/23. Although this represents a 15% decline in syringe coverage since the high of 129% in 2019/20, syringe coverage was likely artificially inflated in 2019/20 due to stockpiling of syringes that occurred at the start of the COVID-19 pandemic (see Figure 4.1).

Figure 4.6 Mid-point, upper and lower estimates of the proportion of injections covered by a sterile syringe among PWID*, 2013/14-2022/23

Note: * Syringe coverage among people who inject on a regular basis (excluding those who inject occasionally)

5. Future Directions

This is the eighth annual National Data Report for the NSP NMDC project. The NSP NMDC Data Dictionary developed in 2017 was updated in 2019 and again in 2023 to reflect improvements in national alignment. The NSP **NMDC** Dictionary provides the framework for national collection of NSP NMDC data elements and is a working document that be updated will as required, after consultation with the NSP **NMDC** Reference Group.

Data from 2008 were used as the baseline to assess temporal trends in the number and type of NSP services (Section 2), as data from intermediary years (2009-2015) was unavailable. Available historical data were used to present past decade temporal trends in needle and syringe distribution (Section 4).

Alignment of data collected in jurisdictions has improved for several data elements, most notably in relation to client-level OOS elements (Section 3. Service provision). The NSP NMDC project and stakeholders were aware misalignment in multiple data elements when the NSP NMDC data elements were agreed in 2015. The limitations of data elements that remain misaligned are discussed in Methodological Notes at Appendix A.

The NSP NMDC Reference Group will continue to provide input into the feasibility and practicality of collecting and reporting additional elements such as the extent to which ancillary injecting equipment is provided through NSP services and the potential for additional disaggregation of needle and syringe distribution by provider type as outlined in the UNAIDS Global AIDS Monitoring 2023 framework.

Appendix A: Methodological Notes

Data collection

The following data were provided by each state and territory Health Department:

- Agency-level administrative data, including outlet type and location of all NSPs operating at 30 June 2023.
- Demographic and drug use data for attendees at public sector (primary and secondary) NSPs on a snapshot day February in 2023.
- 3) Quarterly needle syringe distribution data by public and pharmacy sector.

Ethical approval for the NSP NMDC was obtained from the UNSW Sydney Human Research Ethics Committee-A. Formal written permission to access jurisdictional data was sought and obtained from state and territory Health Departments.

Data analysis

Data coding, cleaning and analysis was conducted using Microsoft Excel, version 2310 (Build 16924.20150, Microsoft Office 365 Apps for enterprise (Microsoft Corporation, Redmond WA) and Stata/IC version 14.2 (StataCorp LP, College Station TX).

In 2023, geocoding of NSP outlet locations used street address, suburb, postcode and state to obtain latitude, longitude and SA1. Concordance tables from the ABS and Australian Government Department of Health determined RA, GCCSA, SA2, SA3, SA4 and Primary Health Network based on the SA1 values.

Data comparison notes and limitations

The data presented in the eighth annual NSP NMDC are subject to limitations and data may need to be converted from financial to calendar year for external reporting. Although overall alignment and completion of NSP NMDC data elements was high in 2023, exceptions are highlighted below.

Some jurisdictions use additional categories to describe the NSP outlet type (for example 'Enhanced Primary' and 'Enhanced Secondary'). In consultation with the relevant jurisdictions and in line with recommendations from the NSP NMDC Reference Group, these NSPs were recoded to the most appropriate 'primary' or 'secondary' definition.

The count of NSPs comprised the total of primary + secondary + pharmacy + SDMs. Where NSP outlets also had SDM(s) these were counted as separate NSPs for the purpose of the NSP NMDC. Historical data on the number of NSPs was obtained from NSP Return on Investment 2 report¹⁰.

Age group categories were not aligned with ABS AGE10P in one jurisdiction in years 2019 to 2022 and young people (aged <25 years) in all years. Data was adjusted, on a proportional basis using age distributions from remaining jurisdictions. These adjustments may have resulted in a slight over-estimate of the proportion of young people.

One jurisdiction did not collect data on Indigenous status in years 2019 to 2022, and one jurisdiction did not collect data on Indigenous status in 2019. jurisdictions collected data as per the ABS definition, while one jurisdiction collected Indigenous status as a binary yes/no. One jurisdiction did not collect data on drug injected in years 2019 to 2022. Two jurisdictions collected drug injected where data aligned with ABS Drugs of Concern Broad Groups but did not align with Base Groups.

The capacity for secondary NSP outlets to provide health education interventions and referrals may be limited and secondary outlets do not generally collect this information. One jurisdiction provided collated quarterly data for health education interventions and referrals and estimate of the mean number of daily education health interventions referrals was generated. It should also be noted that NSP services provide a range of health education interventions to a wide range of external agencies and to the general community. Not all interventions are included in the NSP NMDC minimum data elements, as agreed by the project Reference Group, and are beyond the scope of this report.

One jurisdiction provided data on the number of combined needles and syringes plus needles distributed without syringes. This inconsistency would have minimal impact on the total number of needles and syringes distributed or temporal trends in syringe distribution or syringe coverage.

PWID population size estimates

PWID population size estimates to 2005 were calculated by Razali et al (2007)²¹. The NSP NMDC project used the method described by Kwon et al (2019)²² to estimate relative change in the Australian population of people who inject drugs on a regular basis from 2005 using the following indicators (Tables A1-A6):

- A1) Lifetime and recent (last 12 months) injection of illicit drugs.
- A2) Illicit drug arrests for amphetaminetype stimulants, heroin/other opioids, cocaine and steroids.
- A3) ATS, heroin and steroid seizures
- A4) Unintentional deaths due to opioids among those aged 15-54 years.
- A5) Opioid-related hospitalisations among those aged 10-59 years.
- A6) HCV notifications among 15-24 years.

Given each of these six indicators is an incomplete measure of probable trends in injection drug use, a best estimate was generated using a combined mean of all indicators. This was used to calculate the relative change in injection drug use since 2005, with log function used to obtain a smooth fit of the data (Figure A.1). Estimates of the Australian population of people who inject drugs on a regular basis 2000/01 to 2022/23 are presented in Figure A.2. As shown in Tables A1-A6, there is a lag in the availability of data for some indicators and it should be noted that illicit drug arrests and seizures data for 2021/22 were not available at time of publication of this report.

Table A.1 National lifetime and recent (past 12 months) injection of illicit drugs (%) among people aged 14 years or older, 2001-2019

	2001	2004	2007	2010	2013	2016	2019
Lifetime inject	1.8	1.9	1.9	1.76	1.5	1.6	1.5

B.2 Australian Capital Territory

Description of NSP services in Australian Capital Territory

The Australian Capital Territory (ACT) has the smallest land area of the eight states and territories and has the second smallest population (~465,000 residents in 2023). Two primary NSPs operate in the ACT, operated by Directions Health Services and providing an extended range of injecting equipment and other support services to people who inject drugs. Services include information and education on issues relating to safe injecting practices and health, and referrals to a range of health and social services, including drug treatment services. A more limited range of injecting equipment is available through 14 secondary NSPs and 42 pharmacy NSP outlets. There are 10 SDMs in the ACT, located outside health centres. These machines contain '4 packs' (including 4 x sterile 1ml combined needle and syringe, swabs, water, spoons and cotton wool within a safe disposal container), available for \$2 per pack and enabling 24-hour access to sterile injecting equipment. Client-level OOS data are collected at both primary NSPs and some secondary NSPs. Collated monthly data are provided to ACT Health Directorate on a 6-monthly basis.

Table B.2.1 Needle and syringe distribution by public and pharmacy sector, 2013/14–2022/23

ACT	Public	%	Pharmacy	%	Total
2013/14	529,244	87%	76,800	13%	606,044
2014/15	536,412	89%	63,120	11%	599,532
2015/16	542,772	88%	71,520	12%	614,292

B.3 New South Wales

Description of NSP services in New South Wales

New South Wales (NSW) is the most populous of Australia's eight states and territories, with ~8.3 million people residing in NSW in 2023. NSW Health is responsible for the operation of the NSP via Local Health Districts and non-government organisations. There are 31 primary outlets, 240 secondary outlets, 636 pharmacy NSPs and 287 SDMs in NSW. The extensive network of SDMs (including internal dispensing chutes) are predominantly located in or near community health centres and hospital emergency departments. Cost of injecting equipment at SDMs is typically free or provided at a cost of up to \$4.00. Client-level OOS data are collected through the Ministry of Health BRISE funded NSW NSP Enhanced Data Collection (NNEDC) project. The NNEDC collects data from ~50 NSPs, including all primary NSPs and some secondary NSPs over a two-week period in late February/early March. NSP NMDC data elements included in the NNEDC are: age, gender, Indigenous status and drug injected. NSW Health provides collated quarterly data on needle and syringe distribution and health education/interventions and referrals.

Table B.3.1 Needle and syringe distribution by public and pharmacy sector, 2013/14–2022/23

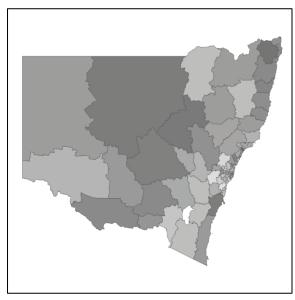

NSW	Public	%	Pharmacy	%	Total

B.4 Northern Territory

Description of NSP services in Northern Territory

The Northern Territory has the third largest land area of Australia's eight states and territories but has the smallest population at ~251,000 residents in 2023. There are 3 primary outlets, 12 secondary outlets, 21 pharmacy NSPs and 8 SDMs (known as After Hours Dispensing Units (ADUs)). All of the primary NSP outlets are operated by the Northern Territory AIDS and Hepatitis Council (NTAHC) and provide a broad range of injecting equipment alongside information, support and referral services for PWID and facilities for the safe disposal of used injecting equipment. Secondary and pharmacy–based outlets typically provide a limited range of sterile injecting equipment and disposal facilities. ADUs were introduced in late 2016 and injecting equipment is accessed through tokens which are obtained free of charge from NSP services in the NT or from packs previously obtained from an ADU. Non-identifiable client-level and service–level OOS data are collected at all primary and some secondary NSP services in the NT and line-item data are provided to NT Government Department of Health on a monthly basis.

Table B.4.1 Needle and syringe distribution by public and pharmacy sector, 2013/14-2022/23

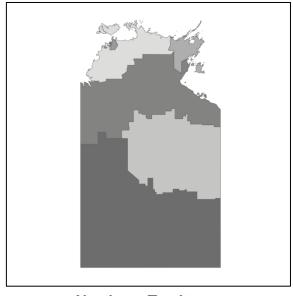

NT	Public	%	Pharmacy	%	Total

B.5 Queensland

Description of NSP services in Queensland

Queensland has the second largest land area of Australia's eight states and territories and has the third largest population, with ~5.4 million residents in 2023. Queensland NSP (QNSP) supports a network of 20 primary NSPs, 117 secondary NSPs, 892 pharmacy NSPs and 70 SDMs. QNSP provides sterile injecting equipment, facilitates the safe disposal of used injecting equipment and improves access and referral to drug treatment programs, health care and other health services. SDMs provide sterile injecting equipment at a fixed cost of \$2 per pack. The Queensland NSP Minimum Data Set (QNSPMDS) is a state-wide standardised data collection system that provides core data about program activities. QMDS requires the collection of non-identifiable client-level and service—level OOS data at all primary and some secondary NSPs throughout Queensland. Line-item OOS data are entered directly into the QNSPMDS database via Power Apps and displayed on QNSPMDS Power Bi dashboard.

Table B.5.1 Needle and syringe distribution by public and pharmacy sector, 2013/14-2022/23

B.6 South Australia

Description of NSP services in South Australia

South Australia (SA) has the fourth largest land area of Australia's eight states and territories and is the fifth most populous, with ~1.84 million residents in 2023. The 'Clean Needle Program' provides a range of services to people who inject drugs including the distribution of sterile needles and syringes and disposal equipment, the provision of information and education about safer injecting practices and safe disposal practices, and referral to a variety of services such as drug treatment, health, legal, and social services. CNP services are provided at a range of sites in metropolitan and regional South Australia with 8 primary outlets, 77 secondary outlets, 315 pharmacy NSPs and 19 SDMs. SDMs dispense packs for free or at a cost of \$2 per pack and provide 24 hr access to sterile injecting equipment. Non-identifiable client-level and service—level OOS data are collected at all primary and most secondary NSPs throughout South Australia. Line-item OOS data are provided to SA Health on a monthly basis. OOS data collection in SA includes all NSP NMDC data elements; with Health education/ interventions recorded as a binary (yes/no) response.

Table B.6.1 Needle and syringe distribution by public and pharmacy sector, 2013/14-2022/23

B.7 Tasmania

Description of NSP services in Tasmania

Tasmania has the second smallest land area of Australia's eight states and territories, with a resident population of ~572,000 in 2023. NSP services are delivered through a combination of primary, secondary, pharmacy and SDMs. The NSP operates through a wide range of service providers, including community health services, community service organisations, neighbourhood/community houses, Aboriginal health services, regional hospitals, councils, youth organisations and pharmacies. There are 7 primary outlets, 21 secondary outlets, 97 pharmacy NSPs and 5 SDMs in Tasmania. Non-identifiable client and service—level OOS data are collected at all primary NSPs and some secondary NSPs in Tasmania. Line-item OOS data is accessed in real-time by the Tasmanian Department of Health.

Table B.7.1 Needle and syringe distribution by public and pharmacy sector, 2013/14-2022/23

B.8 Victoria

Description of NSP services in Victoria

Victoria is the second most populous state or territory in Australia, with ~6.76 million residents in 2023. NSP services operate through a wide range of service providers, including funded primary NSPs, community health services, hospital accident and emergency units, municipal councils, drug treatment agencies, youth organisations and participating pharmacies. There are 18 primary outlets, 243 secondary outlets, 488 pharmacies and 27 SDMs in Victoria. Services are provided through fixed site, mobile services, outreach and foot patrol, and SDMs supply injecting equipment at no cost to the consumer. Non-identifiable client-level and service—level OOS data are collected at all primary and secondary NSP services in Victoria. Line-item OOS data are entered directly into the new NSP Portal (NSPP) to collect NSP transaction data in Victoria. The NSP Portal replaces both NSPISAR and paper forms and provides powerful reporting tools, at both agency and Department of Health levels. The NSP Portal went live in late 2022 and there have been a number of technical, change management and user issues which would account for any variation to data reporting over this reporting period. All NSP NMDC client-level and service-level data elements are collected.

Table B.8.1 Needle and syringe distribution by public and pharmacy sector, 2013/14-2022/23

VIC	Public	%	Pharmacy	%	Total

Note: Indigenous status and drug(s) injected not collected in Victoria 2019-2022 & not collected at all sites in 2023. Age groups collected in Victoria not aligned to AGE10P 2019-2022. Referrals and health education/ interventions in Victoria were combined and reported as health education/interventions in the NSP NMDC between 2019-2022.

B.9 Western Australia

Description of NSP services in Western Australia

Western Australia (WA) has the largest land area of Australia's eight states and territories and is the fourth most populous jurisdiction, with ~2.85 million residents in 2023. NSPs are operated by both government and non-government agencies and include needle syringe exchange programs which supply free sterile needles and syringes upon the return of used equipment. NSPs are operated through a combination of fixed-sites, outreach, postal and mobile services. Health service based NSPs provide sterile injecting equipment at no cost through regional hospitals, and some public health units, community health centres, community drug services and other health services. Pharmacy based NSPs are operated on a commercial basis, while all SDMs have no cost to the consumer. In Western Australia there are 20 primary outlets, 109 secondary outlets, 576 pharmacies and 7 SDMs. Non-identifiable client-level and service-level OOS data are collected by selected primary and secondary NSPs on a designated snapshot day on an annual basis in Western Australia. All NSP NMDC client-level and service-level data elements are collected.

Glossary

Broad-level drug groups from the ABS Drugs of Concern Classification¹⁸ relevant to the NSP NMDC:

Analgesics

Broad-level drug group that includes the base-level drug groups of heroin, methadone, morphine and Subutex/buprenorphine.

Stimulants and Hallucinogens

Broad-level drug group that includes the base-level drug groups of amphetamine, methamphetamine (speed, crystal/ice, base) and cocaine.

Anabolic Agents and Selected Hormones

Broad-level drug group that includes the base-level drug groups of steroids, peptides, growth hormone and other PIEDs.

Other

Broad-level drug group that includes the base-level drug groups of Suboxone and 'Other (specified)'.
